1	1. A spindle motor for use in a disk drive having a rotatable head stack assembly, the spindle
2	motor comprising:
3	a spindle motor hub;
4	a magnet radially attached about the spindle motor hub; and
5	a spindle motor stator including:
6	a stator rim; and
7	a plurality of stator teeth arrayed about and internally extending from the
5 8	stator rim, the stator teeth being sized to fit about the magnet in operable
DODLETY 10 8 9 11	communication therewith for rotating the spindle motor hub, the stator teeth having
5 1 0	laminate-layers, the stator teeth having at least one reduced height stator tooth, the
`~! ! 11	reduced height stator tooth having fewer laminate layers than a remainder of the
1 12 12	stator teeth, the reduced height stator tooth being positionable adjacent the head
12	stack assembly for allowing the head stack assembly to pivot over the reduced
1	height stator tooth.

- 1 2. The spindle motor of Claim 1 wherein the reduced height stator tooth has a width greater
- than a remainder of the stator teeth.
- 1 3. The spindle motor of Claim 1 wherein the reduced height stator tooth has a tooth body
- 2 portion and a distal shoe extending from the tooth body portion, the shoe is disposed adjacent the
- 3 magnet.
- 1 4. The spindle motor of Claim 3 wherein the distal shoe extends vertically beyond the tooth
- 2 body portion.

1	5. A spindle motor for use in a disk drive having	rotatable head stack assembly, the spindle
2	motor comprising:	
3	a spindle motor hub;	
4	a magnet radially attached about the sp	indle motor hub; and
5	a spindle motor stator including:	
6	a stator rim; and	1
7	at least one stator tooth extendi	ng from the stator rim, the stator tooth being
8	sized to fit about the magnet in operable	communication therewith for rotating the
9	spindle motor hub, the stator tooth hav	ing a tooth body portion attached to the stator
10	rim and a distal shoe adjacent the mag	et, the distal shoe extends vertically beyond
11	the tooth-body-portion, the stator tooth	being positionable adjacent the head stack
12	assembly for allowing the head stack a	ssembly to pivot over the stator tooth.
1		
		1

	1	6. A spindle motor for use in a disk drive having a rotatable head stack assembly, the
	2	spindle motor comprising:
	3	a spindle motor hub;
	4	a magnet radially attached about the spindle motor hub; and
	5	a spindle motor stator including:
	6	a stator rim formed of at least two vertically stacked stator rim laminate
	7	layers;
	8	a plurality of stator teeth arrayed about and internally extending from the
	9	stator rim, the stator teeth being sized to fit about the magnet in operable
	9 10 11 12	communication therewith for rotating the spindle motor hub, the stator teeth each
	11	being formed of at least two stator tooth laminate layers, the stator tooth laminate
1,11,51	12	layers being respectively attached to the stator rim laminate layers; and
	13	at least one reduced height stator tooth having at least two reduced height
	13	stator tooth laminate layers horizontally off-set from and vertically formed
	15	towards each other, the reduced height stator tooth being positionable adjacent the
1	16	head stack assembly for allowing the head stack assembly to pivot over the
	17	reduced height stator tooth.

- 1 7. The spindle motor of Claim 6 wherein the at least two reduced height stator tooth
- 2 laminate layers include an upper laminate layer and a lower laminate layer, the upper and lower
- 3 laminate layers are horizontally off-set from each other.
- 1 8. The spindle motor of Claim 6 wherein the at least one reduced height stator tooth
- 2 laminate layers include an upper laminate layer, a lower laminate layer, and an inner laminate
- 3 layer between the upper and lower laminate layers, the upper and lower laminate layers are
- 4 horizontally off-set from the inner laminate layer.
- 1 9. The spindle motor of Claim 6 wherein the at least two reduced height stator tooth
- laminate layers include an upper laminate layer and a lower laminate layer, the lower laminate
 - layer extends horizontally from the stator rim, the upper laminate layer is formed towards the
 - lower laminate layer.

1	10.	A spindle motor for use in a disk drive having a rotatable head stack assembly, the
2	spindl	e motor comprising:
3		a spindle motor hub;
4		a magnet radially attached about the spindle motor hub; and
5		a spindle motor stator including:
6		a stator rim formed of at least two vertically stacked stator rim laminate
7		layers;
8		at least one stator tooth internally extending from the stator rim, the stator
1 9		tooth being sized to fit about the magnet in operable communication therewith for
10 10 10 10 10 11 11 12 12		rotating the spindle motor hub, the stator tooth being formed of at least two stator
万 三11		tooth laminate layers horizontally off-set from and vertically formed towards each
) [[] 12		other, the stator tooth laminate layers being respectively attached to the stator rim
13		laminate layers, the stator tooth being positionable adjacent the head stack
13 13 14 15 14 15 14		assembly for allowing the head stack assembly to pivot over the stator tooth.
5 ≟ 1		

- 2 laminate layer and a lower laminate layer, the upper and lower laminate layers are horizontally
- 3 off-set from each other.

- 1 12. The spindle motor of Claim 10 wherein the stator tooth laminate layers include an upper
- 2 laminate layer, a lower laminate layer, and an inner laminate layer between the upper and lower
- 3 laminate layers, the upper and lower laminate layers are horizontally off-set from the inner
- 4 laminate layer.
- 1 13. The spindle motor of Claim 10 wherein the stator tooth laminate layers include an upper
- laminate layer and a lower laminate layer, the lower laminate layer extends horizontally from the
 - stator rim, the upper laminate layer is formed towards the lower laminate layer.

A spindle motor for use in a disk drive having a rotatable head stack assembly, the spindle 14. 1 motor comprising: 2 a spindle motor hub; 3 a magnet radially attached about the spindle motor hub; and 4 a spindle motor stator including: 5 a stator rim; and 6 a plurality of stator teeth arrayed about and internally extending from the 7 stator rim, the stator teeth being sized to fit about the magnet in operable 8 10010 11 12 13 14 14 1 communication therewith for rotating the spindle motor hub, the stator teeth having laminate layers formed to a first thickness, the stator teeth having at least one

reduced height stator tooth, the reduced height stator tooth having laminate layers formed to a second thickness less than the first thickness, the reduced height stator tooth being positionable adjacent the head stack assembly for allowing the head stack assembly to pivot over the reduced height stator tooth.

- 1 15. The spindle motor of Claim 14 wherein the reduced height stator tooth has a width
- 2 greater than a remainder of the stator teeth.

1	16.	A disk drive comprising:
2		a disk drive base;
3		a head stack assembly rotatably attached to the disk drive base; and
4		a spindle motor attached to the disk drive base including:
5		a spindle motor hub;
6		a magnet radially attached about the spindle motor hub; and
7		a spindle motor stator including:
8		a stator rim; and
7		a plurality of stator teeth arrayed about and internally extending from
분 등 10 한 10		the stator rim, the stator teeth being sized to fit about the magnet in operable
11		communication therewith for rotating the spindle motor hub, the stator teeth
12		having laminate layers, the stator teeth having at least one reduced height
三 二 二 二 14		stator tooth, the reduced height stator tooth having fewer laminate layers
교 급 급 14		than a remainder of the stator teeth, the reduced height stator tooth being
15		positionable adjacent the head stack assembly for allowing the head stack
16		assembly to pivot over the reduced height stator tooth.
1		assembly to protover the reduced height states toom.

- 2 a remainder of the stator teeth.
- 1 18. The disk drive of Claim 16 wherein the reduced height stator tooth has a tooth body
- 2 portion and a distal shoe extending from the tooth body portion, the shoe is disposed adjacent the
- 3 magnet.
- 1 19. The disk drive of Claim 18 wherein the distal shoe extends vertically beyond the tooth body
- 2 portion.

1	20.	A disk drive comprising:
2		a disk drive base,
3		a head stack assembly rotatably attached to the disk drive base; and
4		a spindle motor attacked to the disk drive base including:
5		a spindle motor hub;
6		a magnet radially attached about the spindle motor hub; and
7		a spindle motor stator including:
8		a stator rim; and
3 9		at least one stator tooth extending from the stator rim, the stator tooth
₫ 10 =		being sized to fit about the magnet in operable communication therewith for
10 110 111 111		rotating the spindle motor hub, the stator tooth having a tooth body portion
텔 및 12		attached to the stator rim and a distal shoe adjacent the magnet, the distal
⊒ 13 =		shoe extends vertically beyond the tooth body portion, the stator tooth being
13 14 14 15 15		positionable adjacent the head stack assembly for allowing the head stack
15 15		assembly to pivot over the stato tooth.
1		
		assembly to pivot over the stator tooth.

21.	A	disk	drive	comprising:
-----	---	------	-------	-------------

noeuro eroni

1	21.	A disk drive comprising:
2		a disk drive base;
3		a head stack assembly rotatably attached to the disk drive base; and
4		a spindle motor attached to the disk drive base including:
5		a spindle motor hub;
6		a magnet radially attached about the spindle motor hub; and
7		a spindle motor stator including:
8		a stator rim formed of at least two vertically stacked stator rim
9		laminate layers;
10		a plurality of stator teeth arrayed about and internally extending from
11		the stator rim, the stator teeth being sized to fit about the magnet in operable
12		communication therewith for rotating the spindle motor hub, the stator teeth
13		each being formed of at least two stator tooth laminate layers, the stator
14		tooth laminate layers being respectively attached to the stator rim laminate
15		layers; and
16		at least one reduced height stator tooth having at least two reduced
17		height stator tooth laminate layers horizontally off-set from and vertically
18		formed towards each other, the reduced height stator tooth being
19		positionable adjacent the head stack assembly for allowing the head stack
20		assembly to pivot over the reduced height stator tooth.

- 1 22. The disk drive of Claim 21 wherein the at least two reduced height stator tooth laminate
- 2 layers include an upper laminate layer and a lower laminate layer, the upper and lower laminate
- 3 layers are horizontally off-set from each other.
- 1 23. The disk drive of Claim 21 wherein the at least one reduced height stator tooth laminate
- 2 layers include an upper laminate layer, a lower laminate layer, and an inner laminate layer
- between the upper and lower laminate layers, the upper and lower laminate layers are
- 4 horizontally off-set from the inner laminate layer.
- 1 24. The disk drive of Claim 21 wherein the at least two reduced height stator tooth laminate
 - layers include an upper laminate layer and a lower laminate layer, the lower laminate layer
 - extends horizontally from the stator rim, the upper laminate layer is formed towards the lower
 - laminate layer.

1	25.	A disk drive comprising:
2		a disk drive base;
3		a head stack assembly rotatably attached to the disk drive base; and
4		a spindle motor attached to the disk drive base including:
5		a spindle motor hub;
6		a magnet radially attached about the spindle motor hub; and
7		a spindle motor stator including:
8		a stator rim formed of at least two vertically stacked stator rim
5 9		laminate layers;
О 1210		at least one stator tooth internally extending from the stator rim, the
. Б П		stator tooth being sized to fit about the magnet in operable communication
10 10 ID 11 ID 12		therewith for rotating the spindle motor hub, the stator tooth being formed of
		at least two stator tooth laminate layers horizontally off-set from and
13 14 14 15		vertically formed towards each other, the stator tooth laminate layers being
13 13 14		respectively attached to the stator rim laminate layers, the stator tooth being
16		positionable adjacent the head stack assembly for allowing the head stack
17		assembly to pivot over the stator tooth.
1		

- 1 26. The disk drive of Claim 25 wherein the stator tooth laminate layers include an upper
- 2 laminate layer and a lower laminate layer, the upper and lower laminate layers are horizontally
- 3 off-set from each other.
- 1 27. The disk drive of Claim 25 wherein the stator tooth laminate layers include an upper
- 2 laminate layer, a lower laminate layer, and an inner laminate layer between the upper and lower
- 3 laminate layers, the upper and lower laminate layers are horizontally off-set from the inner
- 4 laminate layer.
- The disk drive of Claim 25 wherein the stator tooth laminate layers include an upper laminate layer and a lower laminate layer, the lower laminate layer extends horizontally from the stator rim, the upper laminate layer is formed towards the lower laminate layer.

1	29.	A disk drive comprising:
2		a disk drive base;
3		a head stack assembly rotatably attached to the disk drive base; and
4		a spindle motor attached to the disk drive base including:
5		a spindle motor hub;
6		a magnet radially attached about the spindle motor hub; and
7		a spindle motor stator including:
8		a stator rim; and
3 9		a plurality of stator teeth arrayed about and internally extending from
0 1 <u>0</u> 10		the stator rim, the stator teeth being sized to fit about the magnet in operable
		communication therewith for rotating the spindle motor hub, the stator teeth
10 9 10 10 10 11 10 12		having laminate layers formed to a first thickness, the stator teeth having at
i		least one reduced height stator tooth, the reduced height stator tooth having
F 414		laminate layers formed to a second thickness less than the first thickness, the
13 14 14 14 15		reduced height stator tooth being positionable adjacent the head stack
16		assembly for allowing the head stack assembly to pivot over the reduced

height stator tooth.

17

- The disk drive of Claim 29 wherein the reduced height stator tooth has a width greater
- than a remainder of the stator teeth.

30.
